finish.mean_reflectance = 0.5 ratio; reason: assumed mid-grey interior; Jim's wall finish gives it
finish.sky_angle_degrees = 65 degree; reason: assumed open sky; the site gives it
envelope.wall_r = 20 r_value; reason: assumed R-20 for a SIP wall (ft2 F h per BTU); the SIP thickness gives it
envelope.roof_r = 30 r_value; reason: assumed R-30; the roof build-up gives it
envelope.floor_r = 20 r_value; reason: assumed R-20; the floor build-up gives it
envelope.door_r = 5 r_value; reason: assumed R-5 for an insulated door, not checked against a source
heating.boiler_efficiency = 0.7 ratio; reason: assumed 70 percent; sources run 55 to 80 percent
loft_floor.thickness_mm = 18 mm; reason: assumed: 23/32 in (18 mm) combination subfloor, the IRC subfloor table's panel for a 24 in span, research row bom.subfloor_irc; at 16 in joist spacing a thinner panel may do
joists.member_depth_mm = 140 mm; reason: assumed 2x6; the beam solver says whether it is enough
joists.spacing_mm = 406 mm; reason: 16 in on centre, assumed
header.plies = 2 count; reason: assumed: two plies side by side, 3-1/2 in of LVL or 3 in of 2x lumber, fit inside the SIP's 3-5/8 in core (sip.prs610_core_thickness)
roof_loads.roof_dead_load_psf = 15 psf; reason: assumed: 15 psf, the roof dead load Boise's roof-only header look-up assumes, research row gl.hdr.vl_lookup_roof_only; the roof build-up gives it
roof_loads.deflection_limit_ratio = 240 ratio; reason: assumed: span over 240, the live-load deflection limit of Boise's header tables, research row gl.hdr.vl_limits, applied to the whole load
roof_loads.roof_bears_on = south, north compass_sides; reason: assumed: the roof's 8 ft south hangover can only be carried by members running north-south across the south wall, so the roof bears on the south and north walls

UNMEASURED PIECES

none
